## My pet-projects

[neovide flathub](#) - manifest of neovide code editor on flathub

[nvim\\_config](#) - my neovim config

[md\\_pdf\\_convert](#) - script for converting md files to pdf

[anarchy\\_bot](#) - telegram bot that can promote any user to admin, allows voting to mute users

[tg\\_api\\_gen](#) - library that generates realistic device\_model, app\_version, and system\_version (android and ios) for telegram userbots

[reposter](#) - script for forwarding messages from one telegram channel to another in real time, saves the history of messages edits in the comments, marks the message as deleted if it is deleted, and also notifies when a stream has started in the channel. There is support for messages with multiple attachments. Simple, intuitive and setup and launching

[yt\\_stream\\_recorder](#) - script for recording YouTube streams. You only need to run it once, and while it is running it will record all streams on the selected channel

[suggest](#) - bot that allows you to suggest posts to telegram channels. It is possible to ban a user so that he can no longer suggesting posts, and you can choose the time for which the user will be banned. There is support for messages with multiple attachments

[PrettyGit](#) - user-friendly interface for git, supports commits, pushes, and uploading to [pypi.org](#)

[easysselect](#) - library that allows the user to select between multiple items in the console using the keyboard. Supports very long lists that don't fit on the screen, [rich styles](#), control with buttons up, down, left, right, wasd, j, k, home, end, page up, page down
